Reasons for Allowance

1. Claims 1-9 are allowed.
2. The following is an Examiner's statement of reasons for allowance.

Claim 1 recites novel features of an apparatus for converting a two-dimensional image to a three-dimensional stereoscopic image to display the converted stereoscopic image on a display, comprising:

a current sample image acquisition unit for acquiring a current sample image, obtained by sampling a current input image provided by an image source;

a previous sample image acquisition unit for acquiring a previous sample image, obtained by sampling a previous input image provided by the image source;

a motion detector for detecting a moving pixel and a still pixel through comparison between corresponding pixels within the current and previous sample images;

a region splitting unit for splitting the current sample image into a plurality of search regions and generating a representative value of the moving pixel in each search region using information about the moving pixel detected by the motion detector,

a depth map generator for determining a moving pixel group constructing an object moving in each search region using the representative value of each search region and setting a small weight value for the moving pixel group, to generate a depth map image having the resolution of the original input image; and

a positive parallax processor for generating a left-eye image and a right-eye image such that the depth map image is displayed on the display in such a manner that the moving pixel group is located before the screen of the display and remaining pixel groups are arranged behind the screen.

The prior art of record fails to anticipate or make obvious the novel features (emphasis added on underlined claim limitations) as stated above.
